Usability review of built screens and fix list

Hope, Inc. ERP | Usability Review and Fix List

Task Reference: S1-UIX-05 | Usability review of built screens and fix list Screens

Evaluated: Homepage, Login, Registration, Dashboard, User Management, Rights Dialog

1. Usability Review Findings

Homepage & Navigation

- The landing page layout clearly displays the core modules (Customers, Products, Human Resources, Sales).
- Issue: Action buttons in the header and hero section both point to the same destinations without distinct visual hierarchy.
- Solution: Maintain primary styling for Sign In / Dashboard and secondary outline styling for Register.

Login & Registration

- Issue: Users cannot confirm what password they typed before submitting the form.
- Solution: Add a toggle eye icon inside the password field to switch between masked dots and visible text.
- Issue: Registration does not indicate password strength or minimum character requirements.
- Solution: Add helper text below the password input stating minimum requirements (e.g., 8+ characters).
- Positive Note: The notification banner explaining that all newly registered accounts default to the "User" role successfully sets clear role expectations.

Dashboard (Admin View)

- Issue: Unauthorized or inactive modules on the dashboard can cause confusion if standard users see admin-only options.
- Solution: Dynamically hide or disable unauthorized quick action buttons based on assigned rights.
- Issue: Summary metric cards look like static text rather than clickable areas.
- Solution: Add hover states and pointer cursors so users know clicking a stat card opens that specific module list.

User Management & Rights Dialog

- Issue: Clicking "Block" immediately changes an account state without asking for confirmation, risking accidental account lockouts.
- Solution: Introduce a brief confirmation prompt before applying the Block or Unblock action.
- Issue: Deselecting a parent module checkbox in the Rights Dialog leaves child action checkboxes active.

- Solution: Configure parent module checkboxes so that unchecking them automatically clears and disables all child permissions beneath them.
- Positive Note: Shading soft-deleted or inactive user rows with red-tinted backgrounds makes account status immediately obvious.

2. Prioritized Fix List

P1 (High Priority)

- Add a confirmation prompt before blocking or unblocking a user account in User Management to prevent accidental actions.
- Fix the Rights Dialog so that unchecking a parent module automatically deselects all nested rights under it.

P2 (Medium Priority)

- Add a show/hide password toggle button to both the Login and Registration screens.
- Add password validation helper text to the Registration form.
- Ensure the Dashboard hides or greys out quick action buttons that the logged-in role does not have rights to access.

P3 (Low Priority)

- Add subtle hover effects and navigation links to the Dashboard summary metric cards.
- Verify color contrast ratios on all Active and Inactive table badges for accessibility compliance.
